Chapter 1: Statewide

Note: Figures for this chapter are located on pages 11-18.

Among residents, 7.5 percent of workers are near the traditional retirement age of 65. Most residents are highly tenured (62.8%) and eligible for health insurance (78.5%).

Figure 1.1.1 displays the distribution of private sector Wyoming workers in 2002 by age group and sex. At the far right of the chart, we see that 18.2 percent of workers were classified as having unknown demographics. That is, their gender and age could not be determined. The proportion of unknowns is related to residency and is closely correlated with insurance eligibility.

Men make up a slightly larger proportion of workers than do women, particularly in the 25-34 year-old age group. The picture changes markedly when examining the same distribution for Wyoming residents only (see Figure 1.1.2). The proportion of workers in the Unknown category declines to 2.9 percent when nonresidents are removed. In addition, the proportional difference in 25-34 year-olds between men and women widens to 2.3 percent. The proportions of each age group, by sex, are higher in this figure because of the diminished influence of those in the Unknown category.

Turnover varies considerably when residency is taken into account. Figure 1.1.3 displays the differences in turnover between residents and nonresidents. Nonresidents comprised 23.0 percent of private sector workers in 2002 with a turnover rate of 41.9 percent. The data indicate that nonresidents have less stable employment relationships than do residents. And if working relationships for nonresidents are of short duration, they are less likely to be eligible for insurance benefits than residents, while still requiring some level of health care services.

Figure 1.1.4 supports this observation by comparing the likelihood of benefit offerings for residents and nonresidents. As shown in Figure 1.1.4, 77.5 percent of resident workers were eligible for benefits in 2002Q3 compared to 55.5 percent of nonresident workers. Among resident workers, those who are highly tenured (five or more quarters attached to the same employer), make up three-fifths of the population (see Figure 1.1.5). The next largest group is marginal employees (those attached for short periods with long breaks) at 19.3 percent. Transitioning workers (9.3% of the 2002 total) are in the process of establishing a highly tenured relationship with their employer. Approximately one in ten resident workers were seasonal

employees. Resident workers are more likely to maintain highly tenured relationships with employers. Therefore, they are more likely to be eligible for benefits.

Health insurance is also associated with firm size. The larger the firm, the greater the probability of benefits offering. Figure 1.1.6 shows that 65 percent of workers in 2002 were offered health benefits. The proportion of workers offered benefits climbs steadily from 39 percent to 56 percent as firm size increases from less than 10 employees to 49 employees, with a substantial increase to 81 percent when size increases to 50 or more employees. As shown in Table ii (see page 7), despite the small number of large firms in the state, they employ a large proportion (47.0%) of private sector workers. While the number of workers in the state is concentrated in large (50 or more workers) firms, the number of employers is heavily skewed toward smaller businesses. Table ii shows that more than three-quarters (75.5%) of employers in 2002 averaged less than ten workers, while only 4.1 percent of firms employed 50 or more people.

The ability of workers and employers to pay for health benefits affects the availability of those benefits. Figure 1.1.7 details the relationships between average annual premium costs (paid by employers) and the average quarterly wages by worker tenure. The top bar in Figure 1.1.7 shows the estimated average annual cost of health insurance per worker for all Wyoming workers. During the period for which these estimates were prepared, information regarding the number of workers participating in health insurance was unavailable. Additionally, the capacity to produce cost per participant in health, dependent health, and dental benefits together is under development.

Assuming that workers share at least some of the total premium cost, we see in Figure 1.1.7 that for those in the marginal or seasonal tenure categories, the average annual premium in 2002 (\$2,388) is nearly equal to one quarter's wages (\$2,072 and \$3,230, respectively). The ratio of annual wages to the average annual insurance cost per worker for employers is larger for those either highly tenured or transitioning to highly tenured status, but the average premium still constitutes a substantial proportion of total compensation.

Full-time and part-time worker status also affects the availability of health and other employer-provided benefits. The data in Figure 1.1.8 show not only the differences in benefit offerings between full- and part-time employees, but also how different benefits are made available in the workplace. Whether health, dependent health, or dental, the proportion of full-time workers offered these benefits in each case is much higher than for part-time employees.

Industry		Firm Size (Average Annual Employment)							
		<10	10 - 19	20 - 49	50+	Total			
Mining	Employers	517	104	80	72	77

Total	Employers	13,778	2,301	1,438	743	18,26			
	Row %	75.5 %	12.6%	7.9 %	4.1%	100.09			

Offering benefits to more full-time than part-time workers probably reflects employer retention strategies for employees who generate the most perceived value for their firms. Consequently, the proportions of part-time workers offered these benefits is comparatively low, with approximately one in eight (12%) part-time workers offered benefits.

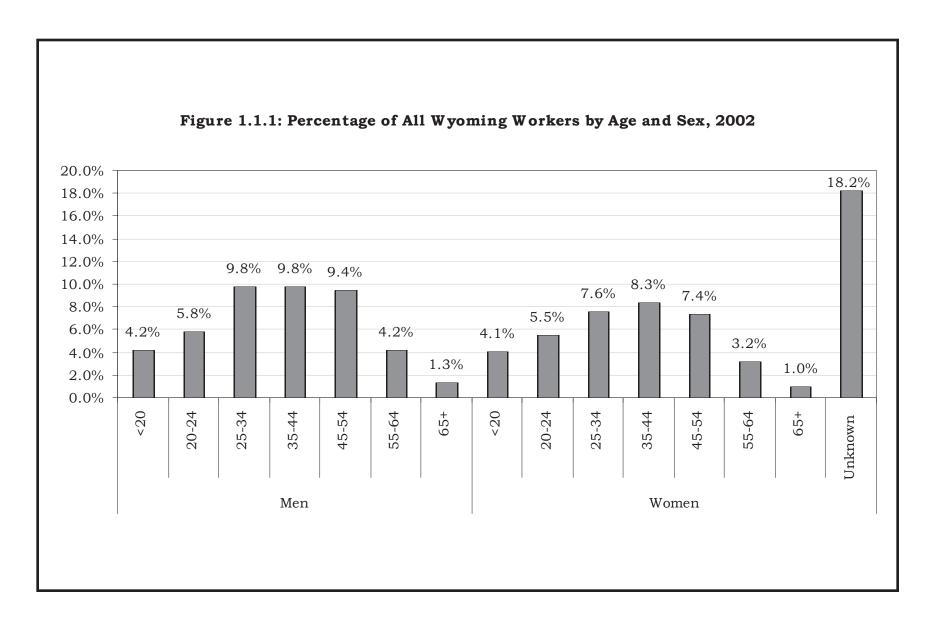

An estimated 34,832 full-time and 49,018 part-time workers were not offered health benefits in 2002 (see Appendix A, pages A5 and A7). Because firm size and compensation are correlated, the 2,301 firms with an average size of 10-19 employees, and the 1,438 firms with 20-49 employees (see Table ii, page 7) in low-turnover industries may prove to be the most promising candidates for the Wyo-Care program. At 17.4 percent, Manufacturing's turnover rate is below the state average of 24.8 percent. Appendix E, page E2 shows that lower turnover levels also characterize Wholesale Trade, Financial Activities, and Education & Health Care. A detailed listing of industry subcategories included within each industry group is located in the Technical Notes on page 130. Appendix A, page A3 reveals that health insurance is not offered to an estimated 7,638 employees in Education & Health Care; 3,738 in Wholesale Trade; 2,955 in Financial Activities; and 1,435 in Manufacturing. The starting point for an insurance initiative could be the almost 16,000 workers not offered health insurance in these four industries, with lower than average turnover.

		Total Employment Estimate	Column %	Full-Time Employment Estimate	Part-Time Employment Estimate	Row %
Industry	Mining	21,195	9.0%	20,155	1,040	4.9%
	Construction	29,195	12.3%	26,064	3,132	10.7%
	Manufacturing	11,780	5.0%	11,075	705	6.0%
	Wholesale Trade, Transportation, & Utilities	18,287	7.7%	16,282	2,006	11.0%
	Retail Trade	37,474	15.8%	27,251	10,223	27.3%
	Information	5,124	2.2%	3,729	1,395	27.2%
	Financial Activities	11,197	4.7%	9,083	2,113	18.9%
	Professional & Business Services	21,151	8.9%	16,819	4,331	20.5%
	Education & Health Care	28,576	12.1%	21,393	7,184	25.1%
	Leisure & Hospitality	43,533	18.4%	23,248	20,285	46.6%
	Other Services	8,921	3.8%	5,663	3,258	36.5%
	Total	236,432	100.0%	180,761	55,671	23.5%
Firm Size	<10 Employees	46,794	19.8%	33,364	13,431	28.7%
	10 - 19 Employees	36,467	15.4%	26,211	10,256	28.1%
	20 - 49 Employees	41,091	17.4%	30,942	10,149	24.7%
	50+ Employees	112,080	47.4%	90,245	21,835	19.5%
	Total	236,432	100.0%	180,761	55,671	23.5%

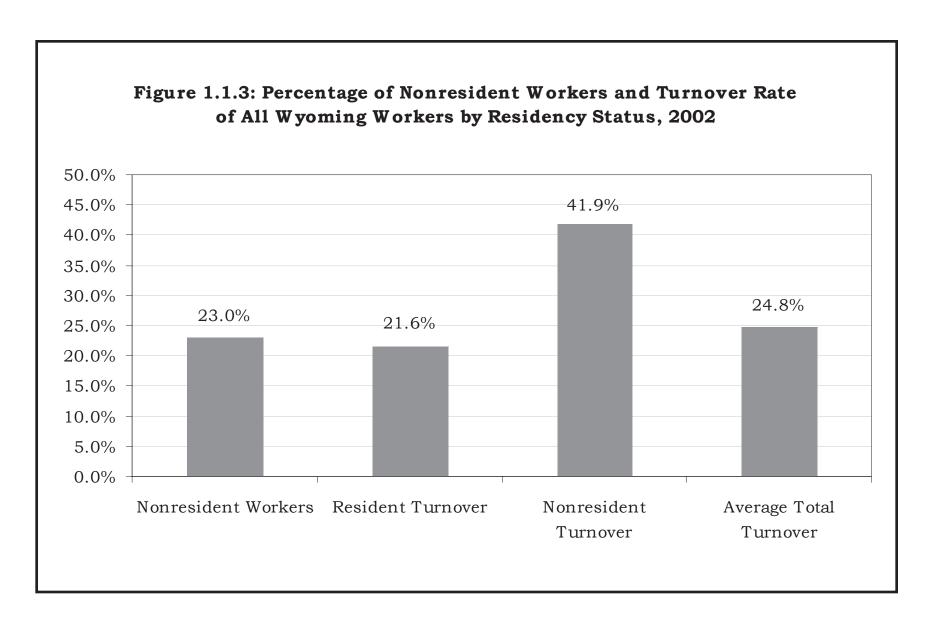

An additional consideration for the Wyo-Care proposal is the potential for employee contributions. As shown in Appendix C, pages C15, C18, C19, C22, and C24, the resident workforce in these industries tends to earn slightly more than the state average. For example, while women age 25-34 earned an average \$15,507 in 2002, they made \$16,869 in Manufacturing and \$19,702 in Financial Activities. However, the available information does not permit a finding regarding employee willingness to make a Wyo-Care contribution.

As shown in Table iii (see page 8), part-time employment makes up nearly half (46.6%) of Leisure & Hospitality's workforce and over one-quarter (27.3%) of Retail Trade's. Leisure & Hospitality and Retail Trade comprise 18.4 and 15.8 percent, respectively of total employment. In addition, they are expanding industries (Leonard, 2003). Given the size of these industries, their projected growth, the large share of part-time employees in Leisure & Hospitality, and the closeness of the distribution of part-time workers in Retail Trade to the state as a whole, these industries are examined in detail. Analysis of the Mining industry is provided for contrast.
